We characterized the smoothness and uniformity of these films by SEM and cross-sectional TEM, profilometry and atomic force microscopy, and provided these films to our partners at ARL and The Aerospace Corporation. Functionalization of the BaTiO nanoparticles with oleic acid prevents aggregation of the 3 particles, permitting complete solubilization in hexane and similar organic solvents. Uniform, well-dispersed films were produced from these solutions by spin-casting on silicon and quartz silica. Analyses by SEM and cross-sectional TEM, profilometry and atomic force microscopy quantified the smoothness and high density of these films. The absence of cracks in these films and their high smoothness confirms the importance of stabilization and dispersion of the nanoparticles with surface functionalities compatible with volatile organic solvents. Two kinds of samples were prepared and sent to The Aerospace Corporation for...
